Project Title	Quiet Space
Project Description	**About the company:** QuietSpace is a project team dedicated to solving the challenges remote workers, freelancers, and students face when trying to find suitable places to focus outside of their homes. Our mission is to leverage technology and community collaboration to create an easy-to-use platform that helps individuals locate and share productive environments, fostering a more connected and efficient work/study culture. **About the project:** QuietSpace is a mobile app built for students, remote workers, and freelancers who need reliable, quiet places to focus. Instead of wasting time searching through trial and error, the app provides a community-driven map of study and work locations like cafés, libraries, campus spaces. Every location is shared and rated by real users, with live updates on noise levels, Wi-Fi speed, seating availability, and outlet access. With a quick glance, you can see whether a space is silent for exam prep, moderately quiet for solo work, or better suited for group study. QuietSpace also learns your preferences over time and gives personalized recommendations to match your study or work style. For those who want more than just solitude, the app offers optional social features. You can check who else is nearby, coordinate study sessions with friends, or even connect with others looking for the same kind of workspace. Beyond convenience, QuietSpace is about community. Every check-in and update help others save time and focus faster. By making productivity more predictable, the app reduces the stress of hunting for a good spot and gives you more hours back in your day. In the future, QuietSpace plans to expand into certified productivity-friendly zones, partner with universities and businesses, and even use AI to predict availability in real time. With features like a built-in Pomodoro timer, gamified check-ins, and trustworthy crowd-verified information, QuietSpace is designed to become the go-to platform for anyone looking to find their focus anywhere.

Problem/ Opportunity Assessment *		
	1.) The Hidden Productivity Cost:	73% of students struggle to find quiet study spaces, directly affecting academic performance. Remote workers waste about 30 to 45 minutes daily searching for suitable spots, often facing poor Wi-Fi, excessive noise, or no seating at some locations.
2.)	**Inaccuracy & Inaccessibility**:	Existing platforms have outdated or missing data on noise levels, Wi-Fi quality, and outlet availability.
3.)	**Community Potential:**	There is a chance to create a reliable, shared, and continuously updated map of study/work locations, fostering both productivity and collaboration.
Desired Project Outcomes/ Requirements*		
		1.) Provides a centralized platform that reduces wasted time by helping users quickly find reliable work or study spaces. 2.) Supplies verified data by users (noise levels, Wi-Fi, seating availability) that existing solutions lack. 3.) Offers personalized recommendations and smart filtering tailored to individual study or work preferences. 4.) Builds a community network where users can collaborate, connect, and contribute, expanding the app's value beyond solitude. 5.) The beneficiary (students, remote workers, freelancers) must be able to: o Access locations with stylized pins and clusters. o Save their favorite spots for future reference and quick access. o Add new locations and provide details such as noise level, Wi-Fi speed, and outlet availability. o Use the Pomodoro timer feature that allows users to set focused work intervals and short breaks, integrated with location check-ins. o Optionally connect with others for shared productivity. o Check-in into the system for users to report on the current conditions of a location using simple sliders and toggles o Filter their options for locations (quietest, highest-rated, most recently updated, by study mode compatibility).

Key Deliverables to be produced by students*		**Student Effort**: • A fully functional mobile application that includes the core features and enhancements: interactive map, location submission, check-in system, favorites, sorting/filtering. • Integrate basic productivity features (Pomodoro timer, badges). • A robust backend that supports user-reported data collection (Wi-Fi, plugs, busyness levels) and sorting/filtering. • A user guide or tutorial on how to use the QuietSpace mobile application, including the new features. **Strategic Corporate Growth**: • **University & Business Partnerships**: Establish formal collaborations with educational institutions to integrate QuietSpace into campusses. This includes negotiating data-sharing agreements with university facility management systems, creating dedicated "QuietSpace Certified" study zones that meet specific productivity standards, and developing marketing campaigns targeting incoming students during orientation periods. • **AI-Powered Predictive Analytics**: Implement machine learning algorithms that analyze historical check-in patterns, academic calendars, and local events to predict space availability with high accuracy. The system will provide hourly forecasts showing expected crowd levels, optimal arrival times, and alternative location suggestions when primary choices are likely to be full. This requires significant data collection along with other resources. • **Social App Integration (StudyBuddy Platform)**: Develop a comprehensive social learning environment featuring matching for study partners, virtual study rooms with shared timers and progress tracking, achievement systems with multiple institutions, and integration with learning management systems (Canvas, Blackboard) for automatic study group formation based on enrolled courses. This expansion requires dedicated community management.
Desired Start Date	Monday, September 15, 2025	
Desired End Date	Friday, March 27, 2026
